HAWKROWN®
WHAT ARE BATHROOM IP ZONES?

TAKE A LOOK AT OUR DIAGRAM ABOVE TO EASILY IDENTIFY YOUR BATHROOM ZONES.

Bathroom zones are areas where electrical products must offer a certain degree of protection against water. The bathroom zone number refers to the amount of water likely to be present. The lower the zone number, the higher the IP rating needs to be. For example, Zone 0 covers areas inside baths or showers. These areas must have a particular minimum IP rating that protects against water immersion - in this case, IP67.

Zone 0

Zone 0 is inside the bath or shower itself. Any fitting used in this bathroom zone must be low voltage, (max 12V) and be rated at least IP67 which is total immersion proof. (We do not currently have any fittings that are suitable for Zone 0)

Zone 1

Zone 1 is the area above the bath to a height of 2.25m from the floor. An IP65 rating is recommended.

Zone 2

Zone 2 is an area stretching 0.6m outside the perimeter of the bath and to a height of 2.25m from the floor. In these bathroom zones an IP rating of at least IP44 is required. In addition, it is good practice to consider the area around a wash basin, within a 60cm radius of any tap, to be considered as Zone 2.

OUTSIDE ZONES

'Outside Zone' is anywhere outside zones 0, 1, and 2 (subject to specific limits) and where no water jet is likely to be used. No IP rating is required. However, if there is a likelihood of water jets being used for cleaning purposes in Zones 1, 2 and 3, a fitting rated to a minimum IP65 must be used.

GUIDE ONLY: Refer to AZ/NZS 3000:2018.
Consult a qualified electrician for interpretation of the Standards for your particular situation.
